AMENDMENT 1
2013-03-15

**Nickel alloys — Determination
of titanium content —
Diantipyrylmethane molecular
absorption spectrometric method**

**AMENDMENT 1: Alternative procedure
for the preparation of the titanium
standard solution**

*Alliages de nickel — Dosage du titane — Méthode par spectrométrie
d'absorption moléculaire au diantipyrylméthane*

*AMENDMENT 1 : Procédure alternative pour la préparation de la
solution étalon de titane*

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

Amendment 1 to ISO 11433:1993 was prepared by Technical Committee ISO/TC 155, *Nickel and nickel alloys*.

Introduction

In the 2008 Systematic review of ISO 11433:1993, *Nickel alloys — Determination of titanium content — Diantipyrylmethane molecular absorption spectrometric method*, ISO/TC 155 recommended the publication of an amendment, because the reagent potassium titanyl oxalate dihydrate is difficult to obtain with a high purity.
